

MISSION OVERVIEW

Grade 5, Mission 4

Multiply and Divide Fractions and Decimals

Students tackled equivalency in adding and subtracting fractions in Mission 3, and now they're ready to focus on multiplying and dividing fractions. Their understanding will be deeply rooted in multiple concrete examples and pictures before they generalize to more abstract methods.

● Measurement, Data, & Shapes

● Fractions & Decimals

IDL = Independent Digital Lessons

SGL = Small Group Lessons

Overview of Topics and Lesson Objectives

Each mission is broken down into topics. A topic is a group of lessons that teach the same concept. For each topic, Zearn offers Whole Group Fluencies, Whole Group Word Problems, Small Group Lessons, and Independent Digital Lessons. There is a balance of Independent Digital Lessons and Small Group Lessons in each topic of a mission to ensure every student learns with a mix of modalities, feedback, and support while engaging in grade-level content. Throughout each mission, students work on grade-level content with embedded remediation to fill gaps in prior knowledge.

| Objective | | INDEPENDENT DIGITAL LESSON | SMALL GROUP LESSON |
|----------------|--|----------------------------|--------------------|
| Topic A | Line Plots of Fraction Measurements 5.MD.2 | | |
| Lesson 1 | Measure and compare pencil lengths to the nearest $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ of an inch, and analyze the data through line plots. | ✓ | ✓ |
| Topic B | Fractions as Division 5.NF.3 | | |
| Lesson 2-3 | Interpret a fraction as division. | ✓ | ✓ |
| Lesson 4 | Use tape diagrams to model fractions as division. | ✓ | ✓ |
| Lesson 5 | Solve word problems involving the division of whole numbers with answers in the form of fractions or whole numbers. | ✓ | ✓ |
| Topic C | Multiplication of a Whole Number by a Fraction 5.NF.4a, 5.MD.1 | | |
| Lesson 6 | Relate fractions as division to fraction of a set. | ✓ | ✓ |
| Lesson 7 | Multiply any whole number by a fraction using tape diagrams. | ✓ | ✓ |
| Lesson 8 | Relate a fraction of a set to the repeated addition interpretation of fraction multiplication. | ✓ | ✓ |
| Lesson 9 | Find a fraction of a measurement, and solve word problems. | ✓ | ✓ |
| Topic D | Fraction Expressions and Word Problems 5.OA.1, 5.OA.2, 5.NF.4a, 5.NF.6 | | |
| Lesson 10 | Compare and evaluate expressions with parentheses. | ✓ | ✓ |

| Objective | | INDEPENDENT DIGITAL LESSON | SMALL GROUP LESSON |
|---|--|----------------------------|--------------------|
| Lesson 11-12 | Solve and create fraction word problems involving addition, subtraction, and multiplication. | ✓ | ✓ |
| Mid-Mission Assessment: Topics A-D | | | |
| Topic E | Multiplication of a Fraction by a Fraction 5.NBT.7, 5.NF.4a, 5.NF.6, 5.MD.1, 5.NF.4b | | |
| Lesson 13 | Multiply unit fractions by unit fractions. | ✓ | ✓ |
| Lesson 14 | Multiply unit fractions by non-unit fractions. | ✓ | ✓ |
| Lesson 15 | Multiply non-unit fractions by non-unit fractions. | ✓ | ✓ |
| Lesson 16 | Solve word problems using tape diagrams and fraction-by-fraction multiplication. | ✓ | ✓ |
| Lesson 17-18 | Relate decimal and fraction multiplication. | ✓ | ✓ |
| Lesson 19 | Convert measures involving whole numbers, and solve multi-step word problems. | ✓ | ✓ |
| Lesson 20 | Convert mixed unit measurements, and solve multi-step word problems. | ✓ | ✓ |
| Topic F | Multiplication with Fractions and Decimals as Scaling and Word Problems 5.NF.5, 5.NF.6 | | |
| Lesson 21 | Explain the size of the product, and relate fraction and decimal equivalence to multiplying a fraction by 1. | ✓ | ✓ |
| Lesson 22-23 | Compare the size of the product to the size of the factors. | ✓ | ✓ |
| Lesson 24 | Solve word problems using fraction and decimal multiplication. | ✓ | ✓ |
| Topic G | Division of Fractions and Decimal Fractions 5.OA.1, 5.NBT.7, 5.NF.7 | | |
| Lesson 25 | Divide a whole number by a unit fraction. | ✓ | ✓ |
| Lesson 26 | Divide a unit fraction by a whole number. | ✓ | ✓ |
| Lesson 27 | Solve problems involving fraction division. | ✓ | ✓ |

| Objective | | INDEPENDENT DIGITAL LESSON | SMALL GROUP LESSON |
|--|---|----------------------------|--------------------|
| Lesson 28 | Write equations and word problems corresponding to tape and number line diagrams. | X | ✓ |
| Lesson 29 | Connect division by a unit fraction to division by 1 tenth and 1 hundredth. | ✓ | ✓ |
| Lesson 30-31 | Divide decimal dividends by non-unit decimal divisors. | ✓ | ✓ |
| Topic H | Interpretation of Numerical Expressions 5.OA.1, 5.OA.2 | | |
| Lesson 32 | Interpret and evaluate numerical expressions including the language of scaling and fraction division. | ✓ | ✓ |
| Lesson 33 | Create story contexts for numerical expressions and tape diagrams, and solve word problems. | ✓ | OPTIONAL |
| End-of-Mission Assessment: Topics E-H | | | |

Foundational Missions

For each mission, Zearn Math highlights the foundational missions, the earlier content where concepts are introduced and developed. Teachers can access foundational missions directly from the mission page of their Teacher Account to address any gaps in prior knowledge. Zearn recommends that teachers assign foundational missions during Flex Day or during additional non-core instruction time. It is important to use a foundational mission to support a struggling student, rather than an unaligned mission, because the content students learn in each foundational mission supports their Core Day learning.

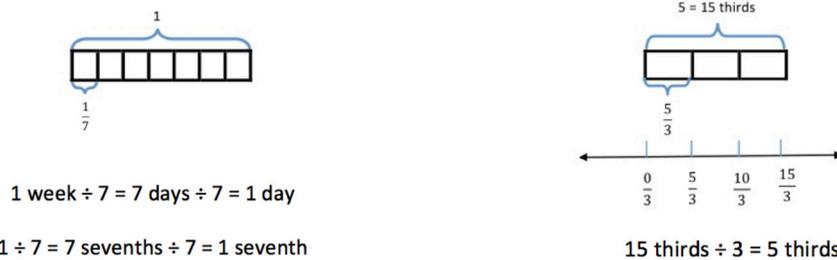

Foundational Mission for G5M4: G4M5 Equivalent Fractions

Mission Overview

In Mission 4, students learn to multiply fractions and decimal fractions and begin working with fraction division. **Topic A** opens the mission with an exploration of fractional measurement. Students construct line plots by measuring the same objects using three different rulers accurate to $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ of an inch (**5.MD.2**).

Students compare the line plots and explain how changing the accuracy of the unit of measure affects the distribution of points. This is foundational to the understanding that measurement is inherently imprecise because it is limited by the accuracy of the tool at hand. Students use their knowledge of fraction operations to explore questions that arise from the plotted data. The interpretation of a fraction as division is inherent in this exploration. For measuring to the quarter inch, one inch must be divided into four equal parts, or $1 \div 4$. This reminder of the meaning of a fraction as a point on a number line, coupled with the embedded, informal exploration of fractions as division, provides a bridge to Topic B's more formal treatment of fractions as division.

Topic B focuses on interpreting fractions as division. Equal sharing with area models (both concrete and pictorial) provides students with an opportunity to understand division of whole numbers with answers in the form of fractions or mixed numbers (e.g., seven brownies shared by three girls, three pizzas shared by four people). Discussion also includes an interpretation of remainders as a fraction (**5.NF.3**). Tape diagrams provide a linear model of these problems. Moreover, students see that, by renaming larger units in terms of smaller units, division resulting in a fraction is similar to whole number division.

Topic B continues as students solve real-world problems (**5.NF.3**) and generate story contexts for visual models. The topic concludes with students making connections between models and equations while reasoning about their results (e.g., between what two whole numbers does the answer lie?).

$$1 \div 7 = \frac{7}{7} \div 7 = \frac{1}{7}$$

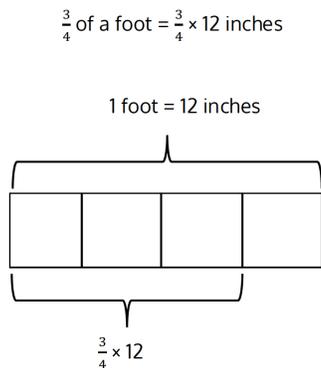

$$5 \div 3 = \frac{5}{3}$$

In Topic C, students interpret finding a fraction of a set ($\frac{3}{4}$ of 24) as multiplication of a whole number by a fraction ($\frac{3}{4} \times 24$) and use tape diagrams to support their understandings (**5.NF.4a**). This, in turn, leads students to see division by a whole number as being equivalent to multiplication by its reciprocal. That is, division by 2, for example, is the same as multiplication by $\frac{1}{2}$. Students also use the commutative property to relate a fraction of a set to the Grade 4 repeated addition interpretation of multiplication by a fraction. This offers opportunities for students to reason about various strategies for multiplying fractions and whole numbers. Students apply their knowledge of a fraction of a set and previous conversion experiences (with scaffolding from a conversion chart, if necessary) to find a fraction of a measurement, thus converting a larger unit to an equivalent smaller unit (e.g., $\frac{1}{3}$ minutes = 20 seconds and $2 \frac{1}{4}$ feet = 27 inches).

Interpreting numerical expressions opens **Topic D** as students learn to evaluate expressions with parentheses, such as $3 \times (\frac{2}{3} - \frac{1}{5})$ or $\frac{2}{3} \times (7 + 9)$ (**5.OA.1**). They then learn to interpret numerical expressions, such as 3 times the difference between $\frac{2}{3}$ and $\frac{1}{5}$ or two-thirds the sum of 7 and 9 (**5.OA.2**). Students generate word problems that lead to the same calculation (**5.NF.4a**), such as "Kelly combined 7 ounces of carrot juice and 5 ounces of orange juice in a glass. Jack drank $\frac{2}{3}$ of the mixture. How much did Jack drink?" Solving word problems (**5.NF.6**) allows students to apply new knowledge of fraction multiplication in

context, and tape diagrams are used to model multi-step problems requiring the use of addition, subtraction, and multiplication of fractions.

Topic E introduces students to multiplication of fractions by fractions—both in fraction and decimal form (**5.NF.4a**, **5.NBT.7**). The topic starts with multiplying a unit fraction by a unit fraction and progresses to multiplying two non-unit fractions. Students use area models, rectangular arrays, and tape diagrams to model the multiplication. These familiar models help students draw parallels between whole number and fraction multiplication, as well as solve word problems. This intensive work with fractions positions students to extend their previous work with decimal-by-whole number multiplication to decimal-by-decimal multiplication. Just as students used unit form to multiply fractional units by wholes in Mission 2 (e.g., $3.5 \times 2 = 35 \text{ tenths} \times 2 \text{ ones} = 70 \text{ tenths}$), they connect fraction-by-fraction multiplication to multiply fractional units-by-fractional units ($3.5 \times 0.2 = 35 \text{ tenths} \times 2 \text{ tenths} = 70 \text{ hundredths}$).

Express $5\frac{3}{4}$ feet as inches.

$$\begin{aligned} 5\frac{3}{4} \text{ feet} &= (5 \times 12) \text{ inches} + \left(\frac{3}{4} \times 12\right) \text{ inches} \\ &= 60 + 9 \text{ inches} \\ &= 69 \text{ inches} \end{aligned}$$

Reasoning about decimal placement is an integral part of these lessons. Finding fractional parts of customary measurements and measurement conversion (**5.MD.1**) concludes Topic E. Students convert smaller units to fractions of a larger unit (e.g., 6 inches = $\frac{1}{2}$ foot). The inclusion of customary units provides a meaningful context for many common fractions (e.g., $\frac{1}{2}$ pint = 1 cup, $\frac{1}{3}$ yard = 1 foot, $\frac{1}{4}$ gallon = 1 quart). This topic, together with the fraction concepts and skills learned in Mission 3, opens the door to a wide variety of application word problems (**5.NF.6**).

Students interpret multiplication in Grade 3 as equal groups, and in Grade 4 students begin understanding multiplication as comparison. Here, in **Topic F**, students once again extend their understanding of multiplication to include scaling (**5.NF.5**). Students compare the product to the size of one factor, given the size of the other factor (**5.NF.5a**) without calculation (e.g., $486 \times 1,327.45$ is twice as large as $243 \times 1,327.45$ because $486 = 2 \times 243$). This reasoning, along with the other work of this mission, sets the stage for students to reason about the size of products when quantities are multiplied by numbers larger than 1 and smaller than 1. Students relate their previous work with equivalent fractions to interpreting multiplication by $\frac{n}{n}$ as multiplication by 1 (**5.NF.5b**). Students build on their new understanding of fraction equivalence as multiplication by $\frac{n}{n}$ to convert fractions to decimals and decimals to fractions. For example, $\frac{3}{25}$ is easily renamed in hundredths as $\frac{12}{100}$ using multiplication of $\frac{4}{4}$. The word form of *twelve hundredths* is then used to notate this quantity as a decimal. Conversions between fractional forms are limited to fractions whose denominators are factors of 10, 100, or 1,000. Students apply the concepts of the topic to real-world, multi-step problems (**5.NF.6**).

Topic G begins the work of division with both fractions and decimal fractions. Students use tape diagrams and number lines to reason about the division of a whole number by a unit fraction and a unit fraction by a whole number (**5.NF.7**). Using the same thinking developed in Mission 2 to divide whole numbers, students reason about how many *fourths* are in 5 when considering such cases as $5 \div \frac{1}{4}$. They also reason about the size of the unit when $\frac{1}{4}$ is partitioned into 5 equal parts: $\frac{1}{4} \div 5$. Using this thinking as a backdrop, students

are introduced to decimal fraction divisors and use equivalent fraction and place value thinking to reason about the size of quotients, calculate quotients, and sensibly place the decimal in quotients (5.NBT.7).

The mission concludes with **Topic H**, in which numerical expressions involving fraction-by-fraction multiplication are interpreted and evaluated (5.OA.1, 5.OA.2). Students create and solve word problems involving both multiplication and division of fractions and decimal fractions.

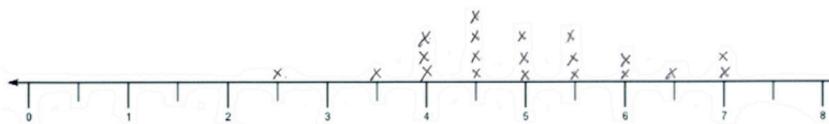

The Mid-Mission Assessment is administered after Topic D, and the End-of-Mission Assessment follows Topic H.

Topic A: Line Plots of Fraction Measurements

LESSONS 1

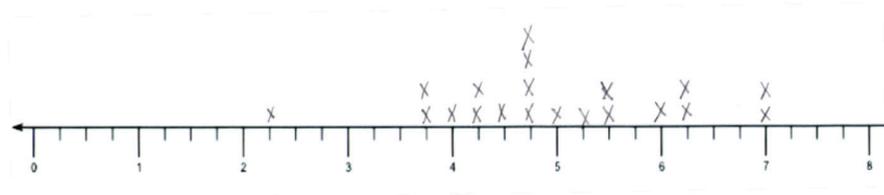

Topic A begins the mission with an exploration of fractional measurement. Students construct line plots by measuring the same objects using three different rulers accurate to $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ of an inch (5.MD.2). Students compare the line plots and explain how changing the accuracy of the unit of measure affects the distribution of points (see line plots at the end of this page). This is foundational to the understanding that measurement is inherently imprecise because it is limited by the accuracy of the tool at hand.

Students use their knowledge of fraction operations to explore questions that arise from the plotted data, such as “What is the total length of the five longest pencils in our class? Can the half-inch line plot be reconstructed using only data from the quarter-inch line plot? Why or why not?” The interpretation of a fraction as division is inherent within this exploration. To measure to the quarter inch, one inch must be divided into 4 equal parts, or $1 \div 4$. This reminder of the meaning of a fraction as a point on a number line, coupled with the embedded, informal exploration of fractions as division, provides a bridge to Topic B’s more formal treatment of fractions as division.

Pencils measured to $\frac{1}{2}$ inch.

Pencils measured to $\frac{1}{4}$ inch.

Topic B: Title in Title Case

LESSONS 2-5

Topic B focuses on interpreting fractions as division. Equal sharing with area models (both concrete and pictorial) provides students with an opportunity to understand the division of whole numbers with answers in the form of fractions or mixed numbers (e.g., seven brownies shared by three girls, three pizzas shared by four people). Discussion also includes an interpretation of remainders as a fraction (5.NF.3). Tape diagrams provide a linear model of these problems. Moreover, students see that, by renaming larger units in terms of smaller units, division resulting in a fraction is similar to whole number division.

Topic B continues as students solve real-world problems (5.NF.3) and generate story contexts for visual models. The topic concludes with students making connections between models and equations while reasoning about their results (e.g., between what two whole numbers does the answer lie?).

Topic C: Multiplication of a Whole Number by a Fraction

LESSONS 6-9

In Topic C, students interpret finding a fraction of a set ($\frac{3}{4}$ of 24) as multiplication of a whole number by a fraction ($\frac{3}{4} \times 24$) and use tape diagrams to support their understandings (5.NF.4a). This, in turn, leads students to see division by a whole number as being equivalent to multiplication by its reciprocal. That is, division by 2, for example, is the same as multiplication by $\frac{1}{2}$.

Students also use the commutative property to relate fraction of a set to the Grade 4 repeated addition interpretation of multiplication by a fraction. This offers opportunities for students to reason about various strategies for multiplying fractions and whole numbers. Students apply their knowledge of fraction of a set and previous conversion experiences (with scaffolding from a conversion chart, if necessary) to find a fraction of a measurement, thus converting a larger unit to an equivalent smaller unit (e.g., $\frac{1}{2}$ minutes = 20 seconds and $2\frac{1}{4}$ feet = 27 inches).

Topic D: Fraction Expressions and Word Problems

LESSONS 10-12

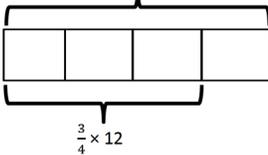

Interpreting numerical expressions opens Topic D as students learn to evaluate expressions with parentheses, such as $3 \times (\frac{2}{3} - \frac{1}{5})$ or $\frac{2}{3} \times (7 + 9)$ (5.OA.1). They then learn to interpret numerical expressions, such as *3 times the difference between $\frac{2}{3}$ and $\frac{1}{5}$ or two thirds the sum of 7 and 9* (5.OA.2). Students generate word problems that lead to the same calculation (5.NF.4a), such as "Kelly combined 7 ounces of carrot juice and 5 ounces of orange juice in a glass. Jack drank $\frac{2}{3}$ of the mixture. How much did Jack drink?" Solving word problems (5.NF.6) allows students to apply new knowledge of fraction multiplication in context, and tape diagrams are used to model multi-step problems requiring the use of addition, subtraction, and multiplication of fractions.

Topic E: Multiplication of a Fraction by a Fraction

LESSONS 13-20

Topic E introduces students to multiplication of fractions by fractions—both in fraction and decimal form (5.NF.4a, 5.NBT.7). The topic starts with multiplying a unit fraction by a unit fraction and progresses to multiplying two non-unit fractions. Students use area models, rectangular arrays, and tape diagrams to model the multiplication. These familiar models help students draw parallels between whole number and fraction multiplication, as well as solve word problems. This intensive work with fractions positions students to extend their previous work with decimal-by-whole number multiplication to decimal-by-decimal multiplication. Just as students used unit form to multiply fractional units by wholes in Mission 2 (e.g., $3.5 \times 2 = 35 \text{ tenths} \times 2 \text{ ones} = 70 \text{ tenths}$), they connect fraction-by-fraction multiplication to multiply fractional units-by-fractional units ($3.5 \times 0.2 = 35 \text{ tenths} \times 2 \text{ tenths} = 70 \text{ hundredths}$).

Reasoning about decimal placement is an integral part of these lessons. Finding fractional parts of customary measurements and measurement conversion (**5.MD.1**) concludes Topic E. Students convert smaller units to fractions of a larger unit (e.g., 6 inches = $\frac{1}{2}$ foot). The inclusion of customary units provides a meaningful context for many common fractions (e.g., $\frac{1}{2}$ pint = 1 cup, $\frac{1}{3}$ yard = 1 foot, $\frac{1}{4}$ gallon = 1 quart). This topic, together with the fraction concepts and skills learned in Mission 3, opens the door to a wide variety of application word problems (**5.NF.6**).

$$\begin{aligned} \frac{3}{4} \text{ of a foot} &= \frac{3}{4} \times (1 \text{ foot}) \\ &= \frac{3}{4} \times (12 \text{ inches}) \\ &= 9 \text{ inches} \\ 1 \text{ foot} &= 12 \text{ inches} \end{aligned}$$

Express $5\frac{3}{4}$ feet as inches.

$$\begin{aligned} 5\frac{3}{4} \text{ feet} &= (5 \times 12) \text{ inches} + \left(\frac{3}{4} \times 12\right) \text{ inches} \\ &= 60 + 9 \text{ inches} \\ &= 69 \text{ inches} \end{aligned}$$

Topic F: Multiplication with Fractions and Decimals as Scaling and Word Problems

LESSONS 21-24

Students interpret multiplication in Grade 3 as equal groups, and in Grade 4, students begin understanding multiplication as comparison. Here, in Topic F, students once again extend their understanding of multiplication to include scaling (**5.NF.5**). Students compare the product to the size of one factor, given the size of the other factor (**5.NF.5a**) without calculation (e.g., $486 \times 1,327.45$ is twice as large as $243 \times 1,327.45$ because $486 = 2 \times 243$). This reasoning, along with the other work of this mission, sets the stage for students to reason about the size of products when quantities are multiplied by 1, by numbers larger than 1, and numbers smaller than 1. Students relate their previous work with equivalent fractions to interpreting multiplication by $\frac{n}{n}$ as multiplication by 1 (**5.NF.5b**).

Students build on their new understanding of fraction equivalence as multiplication by $\frac{n}{n}$ to convert fractions. For example, $\frac{3}{25}$ is easily renamed in hundredths as $\frac{12}{100}$ using multiplication of $\frac{4}{4}$. The word form of twelve hundredths is then used to notate this quantity as a decimal. Conversions between fractional forms are limited to fractions whose denominators are factors of 10, 100, or 1,000. Students apply the concepts of the topic to real-world, multi-step problems (**5.NF.6**).

Topic G: Division of Fractions and Decimal Fractions

LESSONS 25-31

Topic G begins the work of division with fractions—both fractions and decimal fractions. Students use tape diagrams and number lines to reason about the division of a whole number by a unit fraction and a unit fraction by a whole number (**5.NF.7**). Using the same thinking developed in Mission 2 to divide whole numbers, students reason about how many *fourths* are in 5 when considering cases such as $5 \div \frac{1}{4}$. They also reason about the size of the unit when $\frac{1}{4}$ is partitioned into 5 equal parts: $\frac{1}{4} \div 5$. Using this thinking as a backdrop, students are introduced to decimal fraction divisors and use equivalent fraction and place value thinking to reason about the size of quotients, calculate quotients, and sensibly place the decimal in quotients (**5.NBT.7**).

Topic H: Interpretation of Numerical Expressions

LESSON 32-33

The mission concludes with Topic H, in which numerical expressions involving fraction-by-fraction multiplication are interpreted and evaluated (**5.OA.1**, **5.OA.2**). Students create and solve word problems involving both multiplication and division of fractions and decimal fractions.

Terminology

New or Recently Introduced Terms

- **Decimal divisor**

The number that divides the whole and has units of tenths, hundredths, thousandths, etc.

- **Simplify**

Using the largest fractional unit possible to express an equivalent fraction

Familiar Terms and Symbols¹

- **Commutative property**

E.g., $4 \times \frac{1}{2} = \frac{1}{2} \times 4$

- **Conversion factor**

- **Decimal fraction**

- **Denominator**

Denotes the fractional unit, e.g., fifths in 3 fifths, which is abbreviated to the 5 in $\frac{3}{5}$

- **Distribute**

With reference to the distributive property, e.g., in $1\frac{2}{5} \times 15 = (1 \times 15) + (\frac{2}{5} \times 15)$

- **Divide, division**

Partitioning a total into equal groups to show how many units in a whole, e.g. $5 \div \frac{1}{5} = 25$)

- **Equation**

A statement that two expressions are equal, e.g., $3 \times 4 = 6 \times 2$

- **Equivalent fraction**

- **Expression**

- **Factors**

Numbers that are multiplied to obtain a product

- **Foot, mile, yard, inch, gallon, quart, pint, cup, pound, ounce, hour, minute, second**

- **Fraction greater than or equal to 1**

E.g., $\frac{7}{2}$, $3\frac{1}{2}$, an abbreviation for $3 + \frac{1}{2}$

¹ These are terms and symbols students have seen previously.

- **Fraction written in the largest possible unit**
E.g., $\frac{3}{6} = \frac{(1 \times 3)}{(2 \times 3)} = \frac{1}{2}$ or 1 three out of 2 threes = $\frac{1}{2}$
- **Fractional unit**
E.g., the fifth unit in 3 fifths denoted by the denominator 5 in $\frac{3}{5}$
- **Hundredth**
 $\frac{1}{100}$ or 0.01
- **Line plot**
- **Mixed number**
 $3\frac{1}{2}$, an abbreviation for $3 + \frac{1}{2}$
- **Numerator**
Denotes the count of fractional units, e.g., 3 in 3 fifths or 3 in $\frac{3}{5}$
- **Parentheses**
Symbols () used around a fact or numbers within an equation or expression
- **Quotient**
The answer when one number is divided by another
- **Tape diagram**
Method for modeling problems
- **Tenth**
 $\frac{1}{10}$ or 0.1
- **Unit**
One segment of a partitioned tape diagram
- **Unknown**
The missing factor or quantity in multiplication or division
- **Whole unit**
Any unit partitioned into smaller, equally sized fractional units

Suggested Tools and Representations

- **Area models**
- **Number lines**
- **Tape diagrams**

Focus Grade Level Standards

Write and interpret numerical expressions.

5.OA.1

Use parentheses, brackets, or braces in numerical expressions, and evaluate expressions with these symbols.

5.OA.2

Write simple expressions that record calculations with numbers, and interpret numerical expressions without evaluating them. *For example, express the calculation "add 8 and 7, then multiply by 2" as $2 \times (8 + 7)$. Recognize that $3 \times (18,932 + 921)$ is three times as large as $18,932 + 921$, without having to calculate the indicated sum or product.*

Perform operations with multi-digit whole numbers and with decimals to hundredths.

5.NBT.7

Add, subtract, multiply, and divide decimals to hundredths, using concrete models or drawings and strategies based on place value, properties of operations, and/or the relationship between addition and subtraction; relate the strategy to a written method and explain the reasoning used.

Apply and extend previous understandings of multiplication and division to multiply and divide fractions.

5.NF.3

Interpret a fraction as division of the numerator by the denominator ($\frac{a}{b} = a \div b$). Solve word problems involving division of whole numbers leading to answers in the form of fractions or mixed numbers, e.g., by using visual fraction models or equations to represent the problem. *For example, interpret $\frac{3}{4}$ as the result of dividing 3 by 4, noting that $\frac{3}{4}$ multiplied by 4 equals 3, and that when 3 wholes are shared equally among 4 people each person has a share of size $\frac{3}{4}$. If 9 people want to share a 50-pound sack of rice equally by weight, how many pounds of rice should each person get? Between what two whole numbers does your answer lie?*

5.NF.4

Apply and extend previous understandings of multiplication to multiply a fraction or whole number by fraction.

- Interpret the product of $\frac{a}{b} \times q$ as a parts of a partition of q into b equal parts; equivalently, as the result of a sequence of operations $a \times q \div b$. *For example, use a visual fraction model to show $(\frac{2}{5}) \times 4 = \frac{8}{5}$, and create a story context for this equation. Do the same with $(\frac{2}{5}) \times (\frac{1}{2}) = \frac{1}{5}$. (In general, $(\frac{a}{b}) \times (\frac{c}{d}) = \frac{ac}{bd}$.)*

5.NF.5

Interpret multiplication as scaling (resizing), by:

- Comparing the size of a product to the size of one factor on the basis of the size of the other factor, without performing the indicated multiplication.
- Explaining why multiplying a given number by a fraction greater than 1 results in a product greater than the given number (recognizing multiplication by whole numbers greater than 1 as a familiar case); explaining why multiplying a given number by a fraction less than 1 results in a product smaller than the given number; and relating the principle of fraction equivalence $\frac{a}{b} = \frac{(n \times a)}{(n \times b)}$ to the effect of multiplying $\frac{a}{b}$ by 1.

5.NF.6

Solve real-world problems involving multiplication of fractions and mixed numbers, e.g., by using visual fraction models or equations to represent the problem.

5.NF.7

Apply and extend previous understandings of division to divide unit fractions by whole numbers and whole numbers by unit fractions. (Students capable of multiplying fractions can generally develop strategies to divide fractions by reasoning about the relationship between multiplication and division. However, division of a fraction by a fraction is not a requirement at this grade level.)

- Interpret division of a unit fraction by a non-zero whole number, and compute such quotients. *For example, create a story context for $(\frac{1}{3}) \div 4$, and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that $(\frac{1}{3}) \div 4 = \frac{1}{12}$ because $(\frac{1}{12}) \times 4 = \frac{1}{3}$.*
- Interpret division of a whole number by a unit fraction, and compute such quotients. *For example, create a story context for $4 \div (\frac{1}{5})$, and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that $4 \div (\frac{1}{5}) = 20$ because $20 \times (\frac{1}{5}) = 4$.*
- Solve real-world problems involving division of unit fractions by non-zero whole numbers and division of whole numbers by unit fractions, e.g., by using visual fraction models and equations to represent the problem. *For example, how much chocolate will each person get if 3 people share $\frac{1}{2}$ lb of chocolate equally? How many $\frac{1}{3}$ -cup servings are in 2 cups of raisins?*

Convert like measurement units within a given measurement system.

5.MD.1

Convert among different-sized standard measurement units within a given measurement system (e.g., convert 5 cm to 0.05 m), and use these conversions in solving multi-step, real-world problems.

Represent and interpret data.

5.MD.2

Make a line plot to display a data set of measurements in fractions of a unit ($\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$). Use operations on fractions for this grade to solve problems involving information presented in line plots. *For example, given different measurements of liquid in identical beakers, find the amount of liquid each beaker would contain if the total amount in all the beakers were redistributed equally.*

Foundational Standards

4.NF.1

Explain why a fraction $\frac{a}{b}$ is equivalent to a fraction $\frac{(n \times a)}{(n \times b)}$ by using visual fraction models, with attention to how the number and size of the parts differ even though the two fractions themselves are the same size. Use this principle to recognize and generate equivalent fractions.

4.NF.2

Compare two fractions with different numerators and different denominators, e.g., by creating common denominators or numerators, or by comparing to a benchmark fraction such as $\frac{1}{2}$. Recognize that comparisons are valid only when the two fractions refer to the same whole. Record the results of comparisons with symbols $>$, $=$, or $<$, and justify the conclusions, e.g., by using a visual fraction model.

4.NF.3

Understand a fraction $\frac{a}{b}$ with $a > 1$ as a sum of fractions $\frac{1}{b}$.

- Understand addition and subtraction of fractions as joining and separating parts referring to the same whole.
- Decompose a fraction into a sum of fractions with the same denominator in more than one way, recording each decomposition by an equation. Justify decompositions, e.g., by using a visual fraction model. Examples: $\frac{3}{8} = \frac{1}{8} + \frac{1}{8} + \frac{1}{8}$; $\frac{3}{8} = \frac{1}{8} + \frac{2}{8}$;
- $2\frac{1}{8} = 1 + 1 + \frac{1}{8} = \frac{8}{8} + \frac{8}{8} + \frac{1}{8}$.

4.NF.4

Apply and extend previous understandings of multiplication to multiply a fraction by a whole number.

- Understand a fraction $\frac{a}{b}$ as a multiple of $\frac{1}{b}$. For example, use a visual fraction model to represent $\frac{5}{4}$ as the product $5 \times (\frac{1}{4})$, recording the conclusion by the equation $\frac{5}{4} = 5 \times (\frac{1}{4})$.
- Understand a multiple of $\frac{a}{b}$ as a multiple of $\frac{1}{b}$, and use this understanding to multiply a fraction by a whole number. For example, use a visual fraction model to express $3 \times (\frac{2}{5})$ as $6 \times (\frac{1}{5})$, recognizing this product as $\frac{6}{5}$. (In general, $n \times (\frac{a}{b}) = \frac{(n \times a)}{b}$.)
- Solve word problems involving multiplication of a fraction by a whole number, e.g., by using visual fraction models and equations to represent the problem. For example, if each person at a party will eat $\frac{3}{8}$ of a pound of roast beef, and there will be 5 people at the party, how many pounds of roast beef will be needed? Between what two whole numbers does your answer lie?

4.NF.5

Express a fraction with denominator 10 as an equivalent fraction with denominator 100, and use this technique to add two fractions with respective denominators 10 and 100. (Students capable of generating equivalent fractions can generally develop strategies for adding fractions with unlike denominators. However, addition and subtraction with unlike denominators generally is not a requirement at this grade.) For example, express $\frac{3}{10}$ as $\frac{30}{100}$, and add $\frac{3}{10} + \frac{1}{100} = \frac{31}{100}$.

4.NF.6

Use decimal notation for fractions with denominators 10 or 100. For example, rewrite 0.62 as $\frac{62}{100}$; describe a length as 0.62 meters; locate 0.62 on a number line diagram.

Focus Standards for Mathematical Practice

MP.2

Reason abstractly and quantitatively. Students reason abstractly and quantitatively as they interpret the size of a product in relation to the size of a factor, as well as interpret terms in a multiplication sentence as a quantity and scaling factor. Then, students create a coherent representation of the problem at hand while attending to the meaning of the quantities.

MP.4

Model with mathematics. Students model with mathematics as they solve word problems involving multiplication and division of fractions and decimals, as well as identify important quantities in a practical situation and map their relationships using diagrams. Students use a line plot to model measurement data and interpret their results with respect to context of the situation, reflecting on whether results make sense, and possibly improve the model if it has not served its purpose.

MP.5

Use appropriate tools strategically. Students use rulers to measure objects to the $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ inch increments, recognizing both the insight to be gained and limitations of this tool as they learn that the actual object may not match the mathematical model precisely.
